of the study. The authors also note that the use of a single measure of self-esteem may not be sufficient to capture the complexity of this construct. Future research should explore the relationship between self-esteem and life satisfaction using multiple measures and longitudinal designs.

Overall, the findings of this study suggest that self-esteem is a significant predictor of life satisfaction, and that the relationship between the two variables is mediated by psychological well-being. These findings have implications for interventions aimed at improving life satisfaction, as they suggest that interventions that target self-esteem and psychological well-being may be most effective.

Limitations of this study include the use of a cross-sectional design, which does not allow for the establishment of causal relationships between variables. Additionally, the study did not control for other factors that may influence life satisfaction, such as income and social support.

Future research should explore the relationship between self-esteem and life satisfaction in different populations and contexts. Additionally, longitudinal studies that track changes in self-esteem and life satisfaction over time would be valuable in understanding the causal relationships between these variables.

In conclusion, this study provides evidence that self-esteem is a significant predictor of life satisfaction, and that the relationship is mediated by psychological well-being. These findings have implications for interventions aimed at improving life satisfaction, as they suggest that interventions that target self-esteem and psychological well-being may be most effective.
