**Dollhouse Wallpaper Printables**

# Instructions

Thank you for downloading my dollhouse wallpaper printables. I hope you enjoy using them to decorate your dollhouse and I'd love to see how you use them. Feel free to tag me on Instagram (@sunidoll) and/or send me an email at tracey@sunidoll.com

Each wallpaper pattern comes in two scales – 100% and 50% to accommodate different sized dollhouses, eg 1:12 (traditional dollhouse) and 1:6 (Barbie and Blythe). You can use whichever scale you prefer though. Both scales are seamless and have the same printable area.

There are PDFs in both A4 and US letter sizes.

As well as the wallpaper patterns, you will find in the download files a PDF containing a number of solid colours that coordinate with the patterns. This is so you don't have to wallpaper the whole room and/or search for a coordinating paint colour. You can also download printable wall panels from sunidoll.com that add decorative detail and also aid in achieving the height required for 1:6 scale dollhouses.

Note: Although I have provided a seamless 'pattern' for you to use, you will need to trim the pattern from the paper. This is because most home printers don't print to the edge of paper and I didn't want the pattern to get cut off.

For best results print the wall panels on cardstock, around 176gsm weight. You could also use plain computer paper but this is harder to line up and is prone to warping and crinkling.

**Materials you'll need**

1. Dollhouse wallpaper printable PDF
2. White cardstock (preferably minimum 176gsm) – A4 or US letter size
3. Colour printer that can print on cardstock
4. Paper glue, PVA glue or glue of your choice* (see below)
5. Iron* (depending on glue you use - see below)
6. Scissors or craft knife
7. Ruler (optional)
8. Fold scoring tool if using scissors (optional).

**Instructions**

1. Measure the length of your wall and calculate how many copies of the wallpaper printable you'll need.
2. Print the wallpaper PDF on cardstock using your printer's best ink setting.
3. Trim off the white edges of the page. If you're cutting with a craft knife, use a ruler to help cut in a straight line. If you're using scissors, I recommend scoring a straight line first to guide your scissors.
4. Now you can glue the wallpaper to the dollhouse walls. The glue you use will depend on the surface you're attaching the panels to (see below).

**A word about glue choices**

As we're glueing cardstock we don't want to warp it by using a 'liquid' type glue. Paper glue is good for attaching to cardboard walls but it's very quick drying and sometimes it's not easy to position the panels perfectly before the glue dries. An alternative method I learnt from decoupage is to apply a thin coat of PVA glue to the walls and let the glue dry. Then position wallpaper panels where you want them, place a piece of parchment paper over the top and iron in place with a warm, dry iron. I haven't tried this method on foamboard/foamcore – you would need to take care not to melt it. As the iron is only on warm setting it could be ok.
